Lab 7: RIPv2 Router Configuration

Topology Diagram

Addressing Table

Device	Interface	IP Address	Subnet Mask	Default Gateway
R1	Fa0/0	172.30.1.1	255.255.255.0	N/A
	Fa0/1	172.30.2.1	255.255.255.0	N/A
	S0/0/0	209.165.200.230	255.255.255.252	N/A
R2	Fa0/0	10.1.0.1	255.255.0.0	N/A
	S0/0/0	209.165.200.229	255.255.255.252	N/A
	S0/0/1	209.165.200.233	255.255.255.252	N/A
R3	Fa0/0	172.30.100.1	255.255.255.0	N/A
	S0/0/1	209.165.200.234	255.255.255.252	N/A
	Lo0	172.30.110.1	255.255.255.0	N/A
	Lo1	172.30.200.17	255.255.255.240	N/A
	Lo2	172.30.200.33	255.255.255.240	N/A
PC1	NIC	172.30.1.10	255.255.255.0	172.30.2.1
PC2	NIC	172.30.2.10	255.255.255.0	172.30.1.1
PC3	NIC	10.1.0.10	255.255.0.0	10.1.0.1
PC4	NIC	172.30.100.10	255.255.255.0	172.30.100.1

Learning Objectives

Upon completion of this lab, you will be able to:

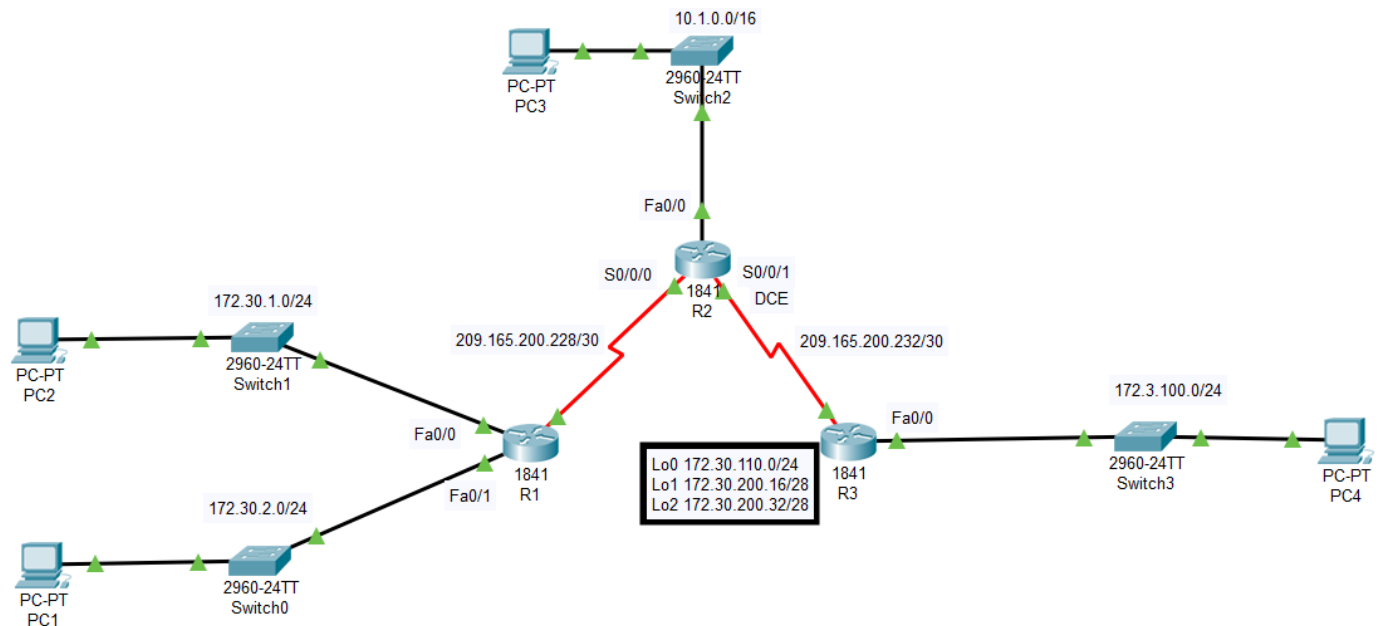

- Cable a network according to the Topology Diagram.
- Load provided scripts onto the routers.
- Examine the current status of the network.
- Configure RIPv2 on all routers.
- Examine the automatic summarization of routes.
- Examine routing updates with `debug ip rip`.
- Disable automatic summarization.
- Examine the routing tables.
- Verify network connectivity.
- Document the RIPv2 configuration.

Scenario

The network shown in the Topology Diagram contains a discontinuous network, 172.30.0.0. This network has been subnetted using VLSM. The 172.30.0.0 subnets are physically and logically divided by at least one other classful or major network, in this case the two serial networks 209.165.200.228/30 and 209.165.200.232/30. This can be an issue when the routing protocol used does not include enough information to distinguish the individual subnets. RIPv2 is a classless routing protocol that can be used to provide subnet mask information in the routing updates. This will allow VLSM subnet information to be propagated throughout the network.

Task 1: Cable, Erase, and Reload the Routers.

Step 1: Cable a network.

Step 2: Clear the configuration on each router.

Clear the configuration on each of routers using the **erase startup-config** command and then **reload** the routers. Answer **no** if asked to save changes.

The screenshot shows a terminal window titled 'R1' with tabs for 'Physical', 'Config', 'CLI', and 'Attributes'. The 'CLI' tab is active, displaying the 'IOS Command Line Interface'. The terminal output shows the following sequence of commands and responses:

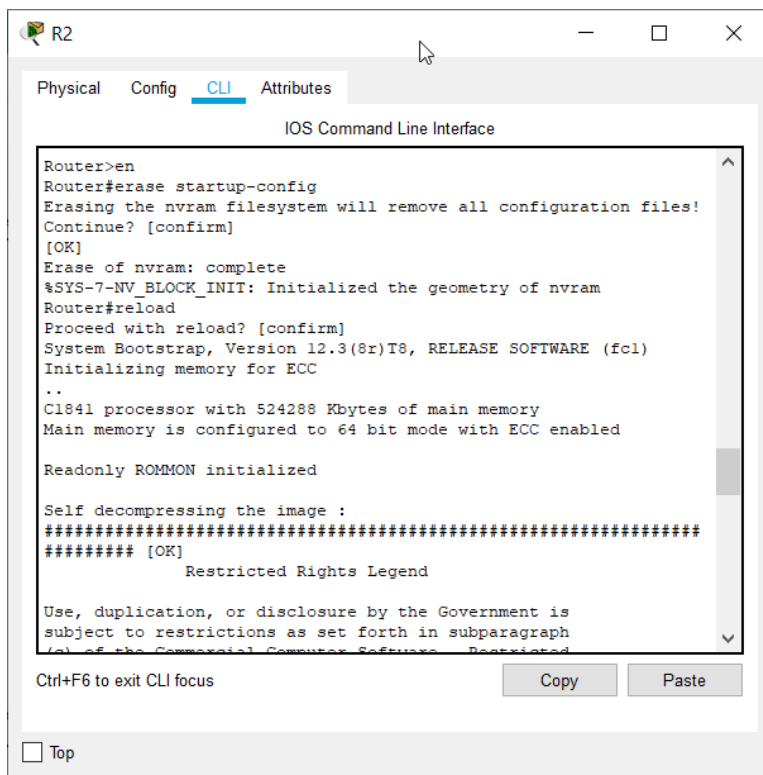

```
R1>
R1>
R1>en
R1#erase startup-config
Erasing the nvram filesystem will remove all configuration files!
Continue? [confirm]
[OK]
Erase of nvram: complete
%SYS-7-NV_BLOCK_INIT: Initialized the geometry of nvram
R1#reload
Proceed with reload? [confirm]
System Bootstrap, Version 12.3(8r)T8, RELEASE SOFTWARE (fc1)
Initializing memory for ECC
..

Use duplication or disclosure by the Government is
```

At the bottom of the terminal window, there is a prompt 'Ctrl+F6 to exit CLI focus' and two buttons labeled 'Copy' and 'Paste'. Below the terminal window, there is a checkbox labeled 'Top'.

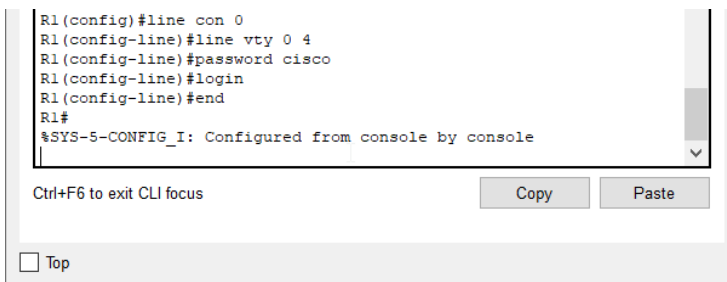

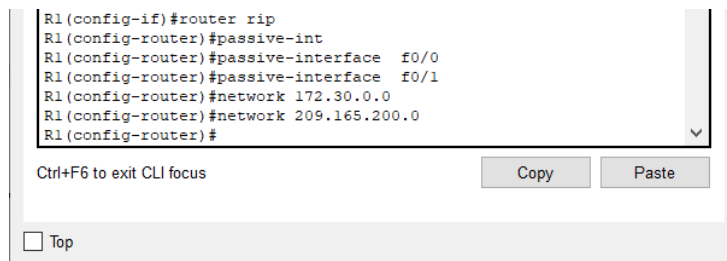

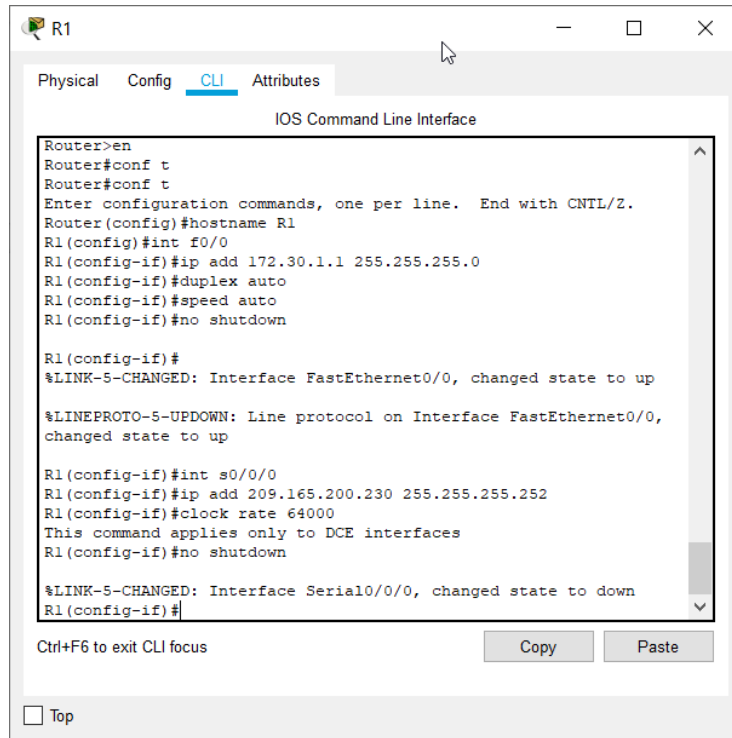

Task 2: Load Routers with the Supplied Scripts.

Step 1: Load the following script onto R1.

```
!  
hostname R1  
!  
!  
!  
interface FastEthernet0/0  
 ip address 172.30.1.1 255.255.255.0

Step 2: Check the connectivity from R2 to the hosts on the R1 and R3 LANs.

Note: For the 1841 router, you will need to disable IP CEF to obtain the correct output from the **ping** command. Although a discussion of IP CEF is beyond the scope of this course, you may disable IP CEF by using the following command in global configuration mode:

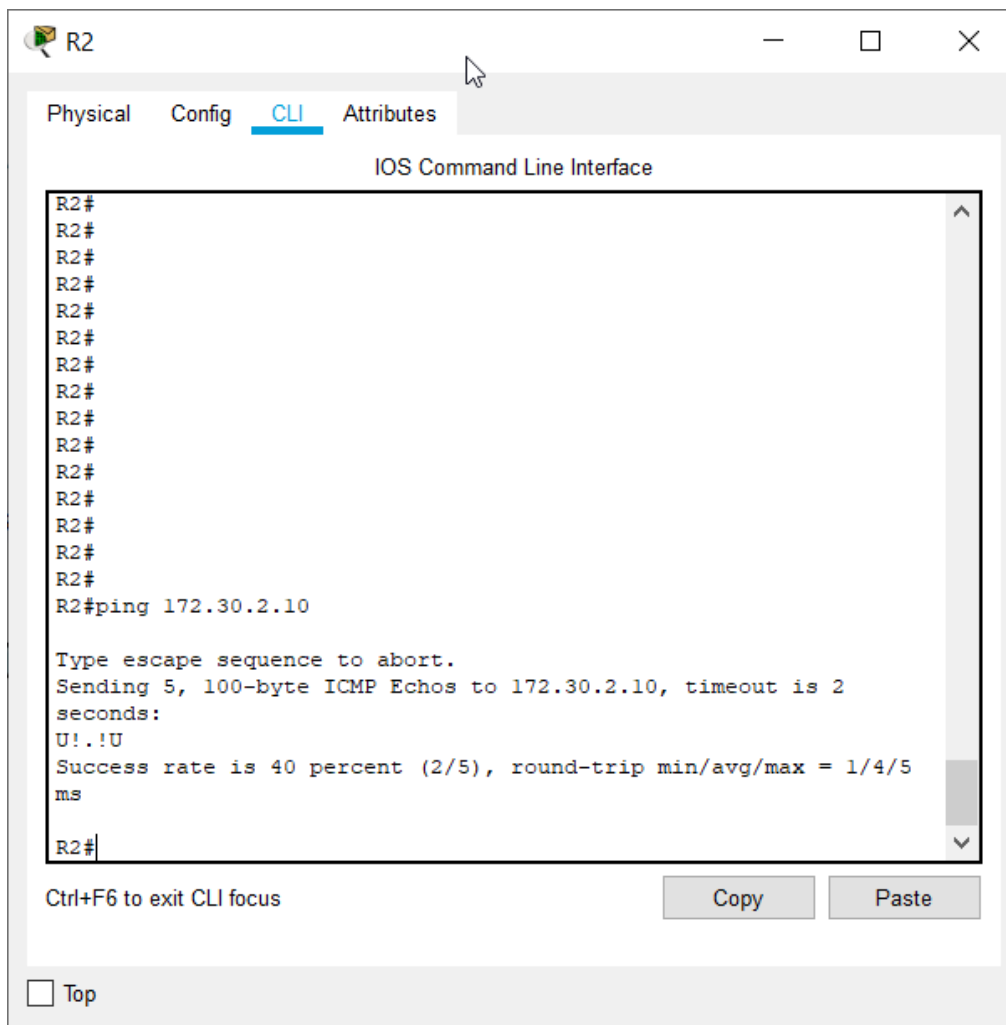

```
R2(config)#no ip cef
```

From the R2 router, how many ICMP messages are successful when pinging PC1?

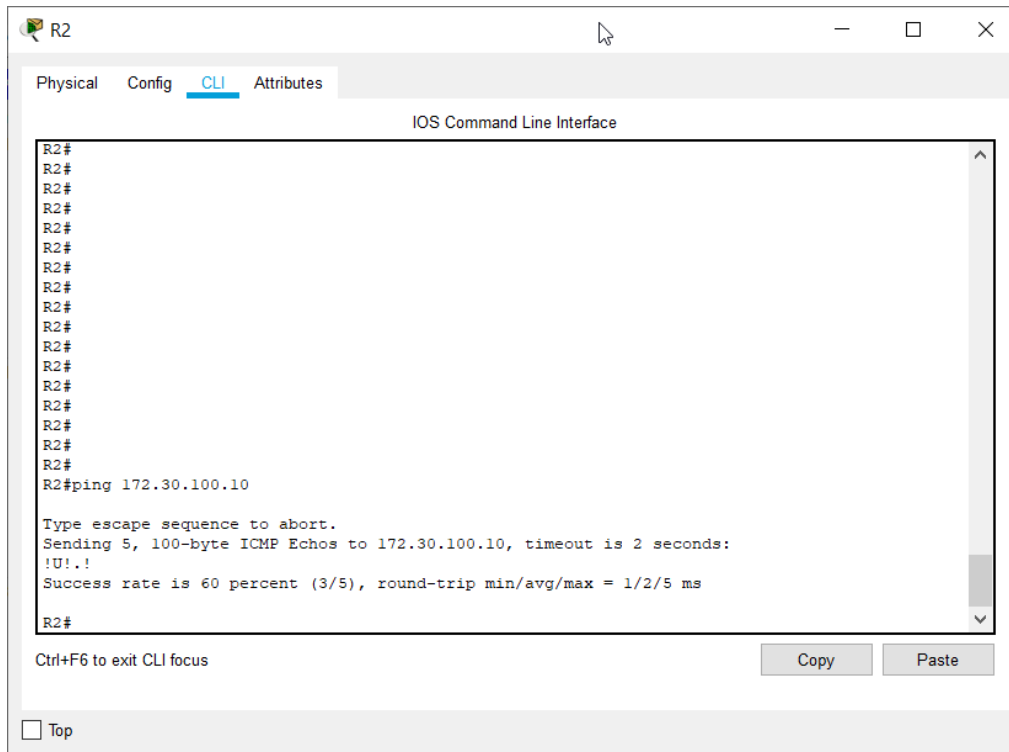

Here we encountered a problem, ping 172.30.1.10 gave 0% success rate, we note that initially 172.30.1.10 doesn't belong to the 172.30.2.10/24 subnet,

So to rectify this, we exchange the IP addresses of PC1 and PC2

2/5 messages are successful when pinging PC1

From the R2 router, how many ICMP messages are successful when pingg PC4?

```
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#
R2#ping 172.30.100.10

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.30.100.10, timeout is 2 seconds:
!U!..!
Success rate is 60 percent (3/5), round-trip min/avg/max = 1/2/5 ms
R2#
```

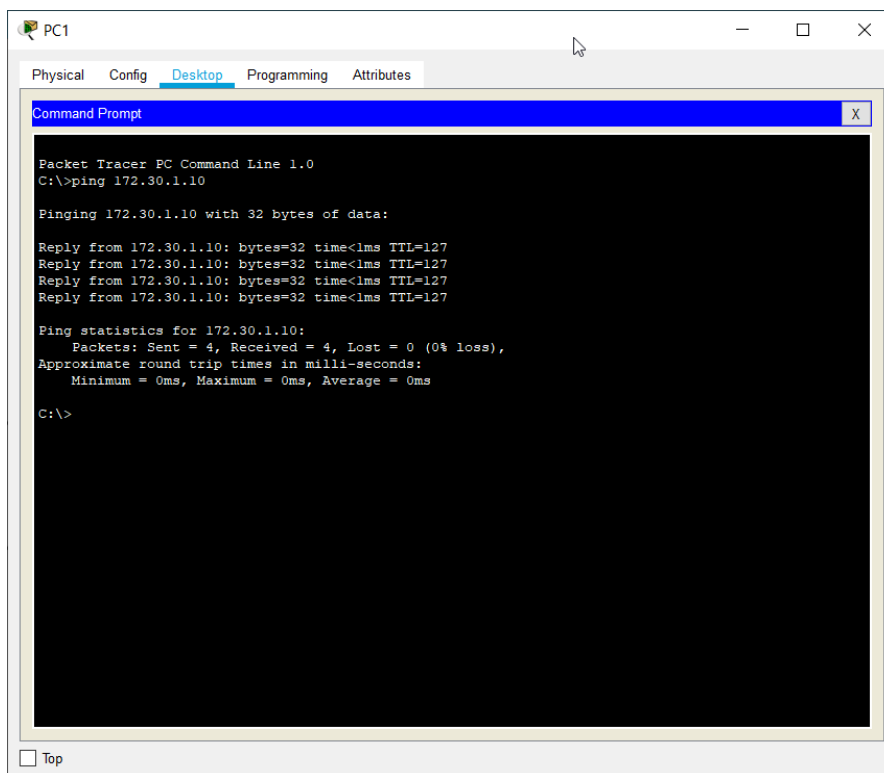

Ctrl+F6 to exit CLI focus

Copy Paste

Request timed out.
Reply from 10.1.0.10: bytes=32 time=1ms TTL=126
Request timed out.

Ping statistics for 10.1.0.10:
    Packets: Sent = 4, Received = 2, Lost = 2 (50% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 1ms, Maximum = 1ms, Average = 1ms

C:\>
```

From the PC4, is it possible to ping PC3? **yes**

What is the success rate? **50%**

Step 4: View the routing table on R2.

Both the R1 and R3 are advertising routes to the 172.30.0.0/16 network; therefore, there are two entries for this network in the R2 routing table. The R2 routing table only shows the major classful network address of 172.30.0.0—it does not show any of the subnets for this network that are used on the LANs attached to R1 and R3. Because the routing metric is the same for both entries, the router alternates the routes that are used when forwarding packets that are destined for the 172.30.0.0/16 network.

The screenshot shows a window titled 'R2' with tabs for 'Physical', 'Config', 'CLI', and 'Attributes'. The 'CLI' tab is active, displaying the 'IOS Command Line Interface'. The command 'R2>en' has been entered, followed by 'R2#show ip route'. The output shows the routing table with various codes and routes. The routes listed are: 10.0.0.0/16 (subnetted, 1 subnet), 10.1.0.0 (directly connected, FastEthernet0/0), 172.30.0.0/16 (via 209.165.200.234, Serial0/0/1), 209.165.200.0/30 (subnetted, 2 subnets), 209.165.200.228 (directly connected, Serial0/0/0), and 209.165.200.232 (directly connected, Serial0/0/1). The prompt 'R2#' is visible at the bottom of the CLI window. Below the CLI window, there are buttons for 'Copy' and 'Paste', and a checkbox labeled 'Top'.

```
R2>en
R2#show ip route
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default, U - per-user static route, o - ODR
       P - periodic downloaded static route

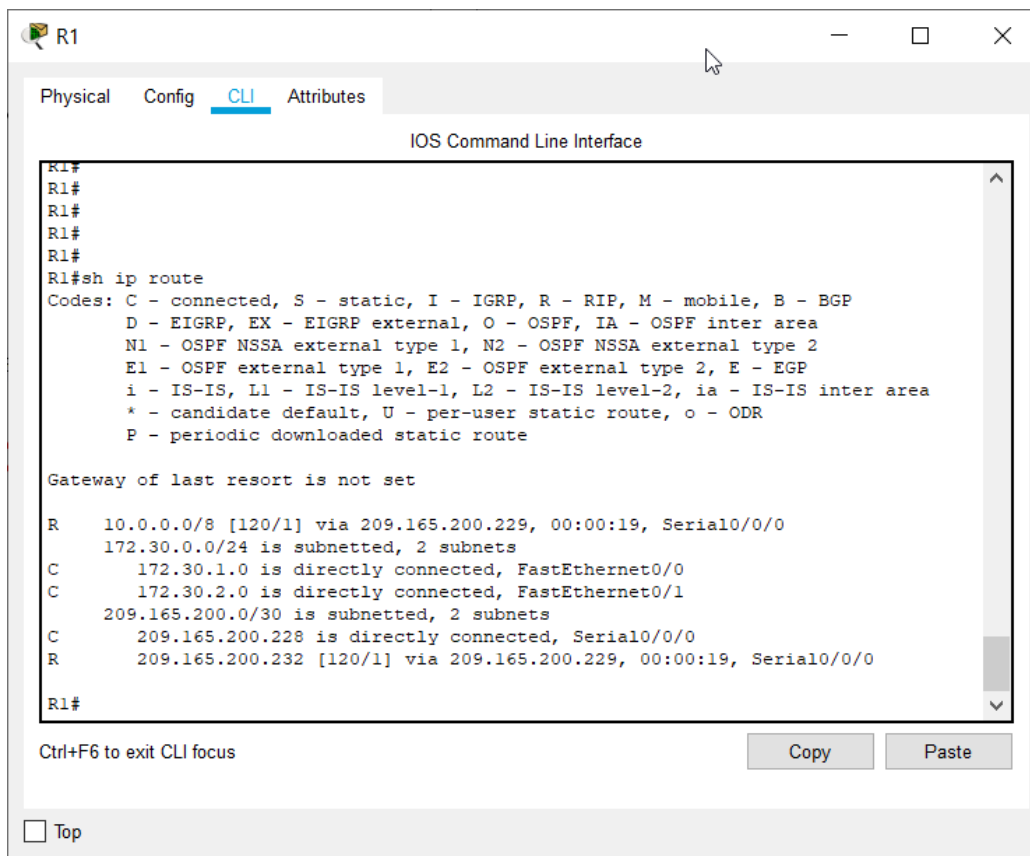

Gateway of last resort is not set

 10.0.0.0/16 is subnetted, 1 subnets
C    10.1.0.0 is directly connected, FastEthernet0/0
R    172.30.0.0/16 [120/1] via 209.165.200.234, 00:00:04, Serial0/0/1
       [120/1] via 209.165.200.230, 00:00:16, Serial0/0/0
 209.165.200.0/30 is subnetted, 2 subnets
C    209.165.200.228 is directly connected, Serial0/0/0
C    209.165.200.232 is directly connected, Serial0/0/1

R2#
```

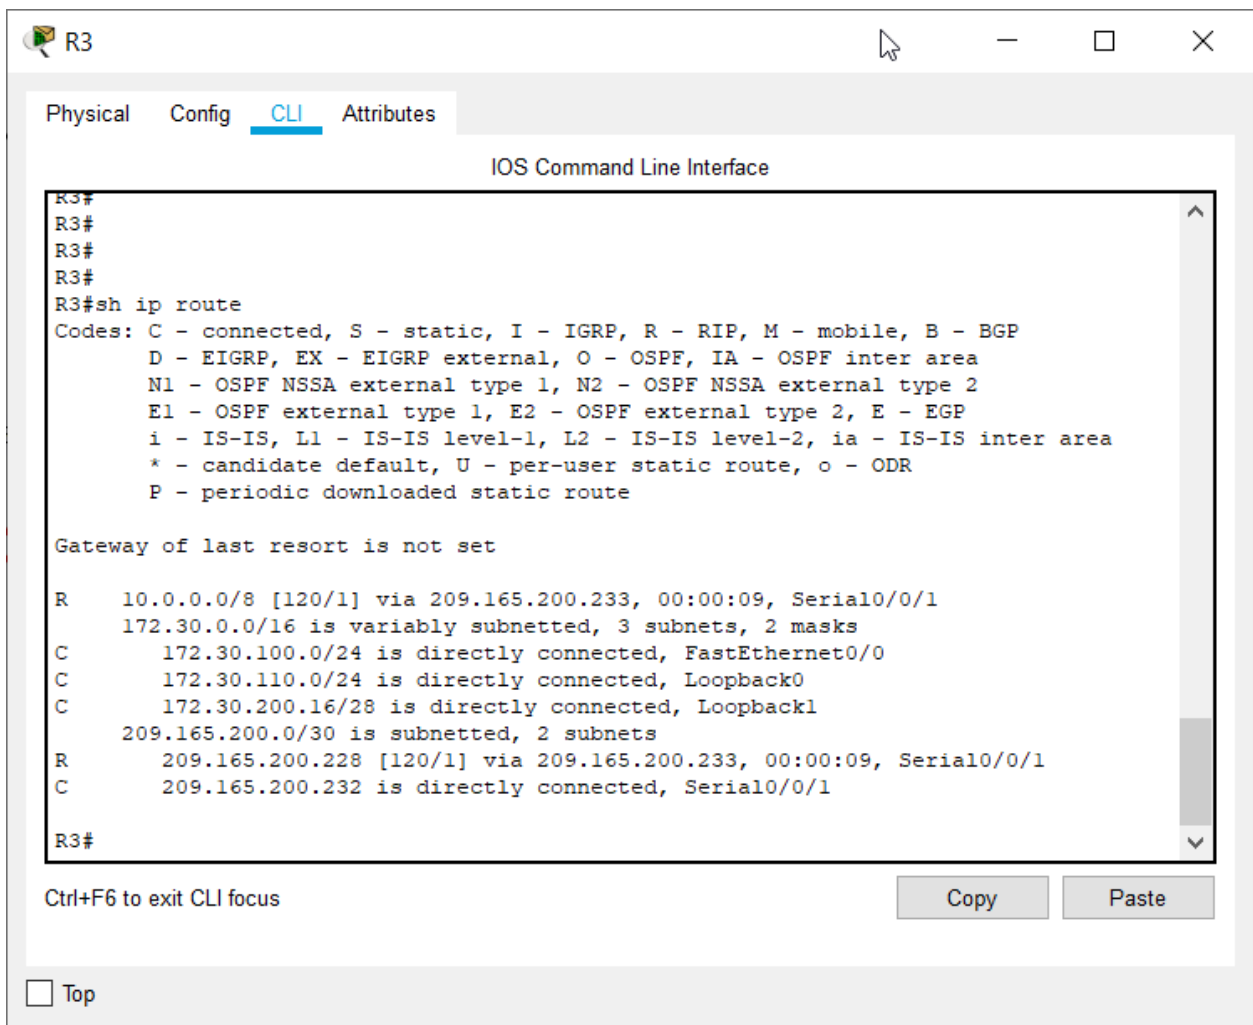

Step 5: Examine the routing table on the R1 router.

Both R1 and R3 are configured with interfaces on a discontinuous network, 172.30.0.0. The 172.30.0.0 subnets are physically and logically divided by at least one other classful or major network—in this case, the two serial networks 209.165.200.228/30 and 209.165.200.232/30. Classful routing protocols like RIPv1 summarize networks at major network boundaries. Both R1 and R3 will be summarizing 172.30.0.0/24 subnets to 172.30.0.0/16. Because the route to 172.30.0.0/16 is directly connected, and because R1 does not have any specific routes for the 172.30.0.0 subnets on R3, packets destined for the R3 LANs will not be forwarded properly.

Step 6: Examine the routing table on the R3 router.

R3 only shows its own subnets for 172.30.0.0 network: 172.30.100/24, 172.30.110/24, 172.30.200.16/28, and 172.30.200.32/28. R3 does not have any routes for the 172.30.0.0 subnets on R1.

The screenshot shows a network simulator window titled 'R3'. It has tabs for 'Physical', 'Config', 'CLI' (which is selected), and 'Attributes'. The main area is titled 'IOS Command Line Interface'. The CLI shows the following text:

```
R3#
R3#
R3#
R3#sh ip route
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default, U - per-user static route, o - ODR
       P - periodic downloaded static route

Gateway of last resort is not set

R    10.0.0.0/8 [120/1] via 209.165.200.233, 00:00:09, Serial0/0/1
    172.30.0.0/16 is variably subnetted, 3 subnets, 2 masks
C    172.30.100.0/24 is directly connected, FastEthernet0/0
C    172.30.110.0/24 is directly connected, Loopback0
C    172.30.200.16/28 is directly connected, Loopback1
    209.165.200.0/30 is subnetted, 2 subnets
R    209.165.200.228 [120/1] via 209.165.200.233, 00:00:09, Serial0/0/1
C    209.165.200.232 is directly connected, Serial0/0/1

R3#
```

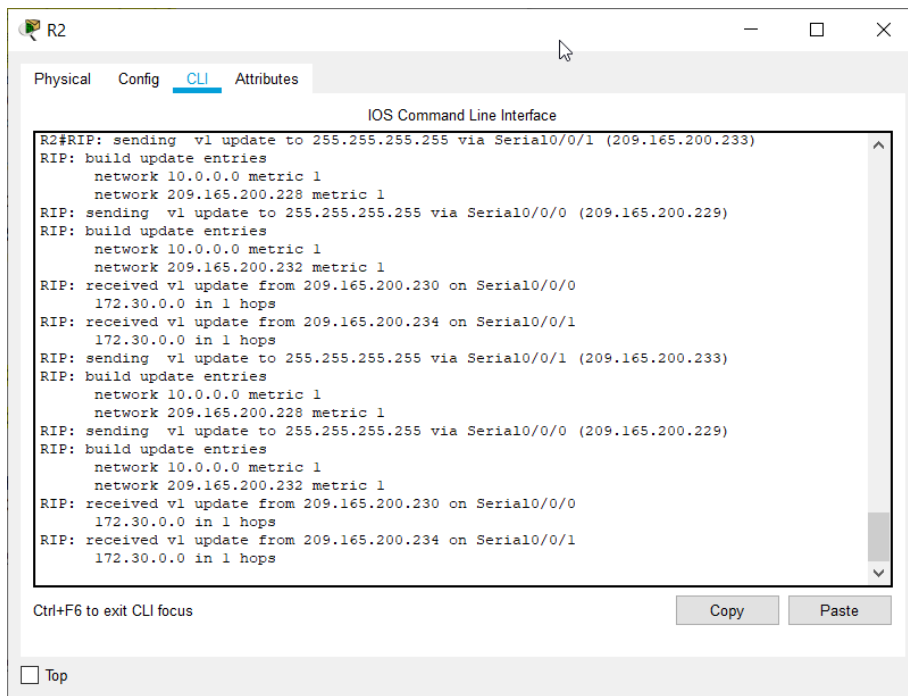

Below the CLI window, there is a text prompt 'Ctrl+F6 to exit CLI focus' and two buttons: 'Copy' and 'Paste'. At the bottom left, there is a checkbox labeled 'Top'.

Step 7: Examine the RIPv1 packets that are being received by R2.

Use the `debug ip rip` command to display RIP routing updates.

R2 is receiving the route 172.30.0.0, with 1 hop, from both R1 and R3. Because these are equal cost metrics, both routes are added to the R2 routing table. Because RIPv1 is a classful routing protocol, no subnet mask information is sent in the update.

```
R2#debug ip rip
```

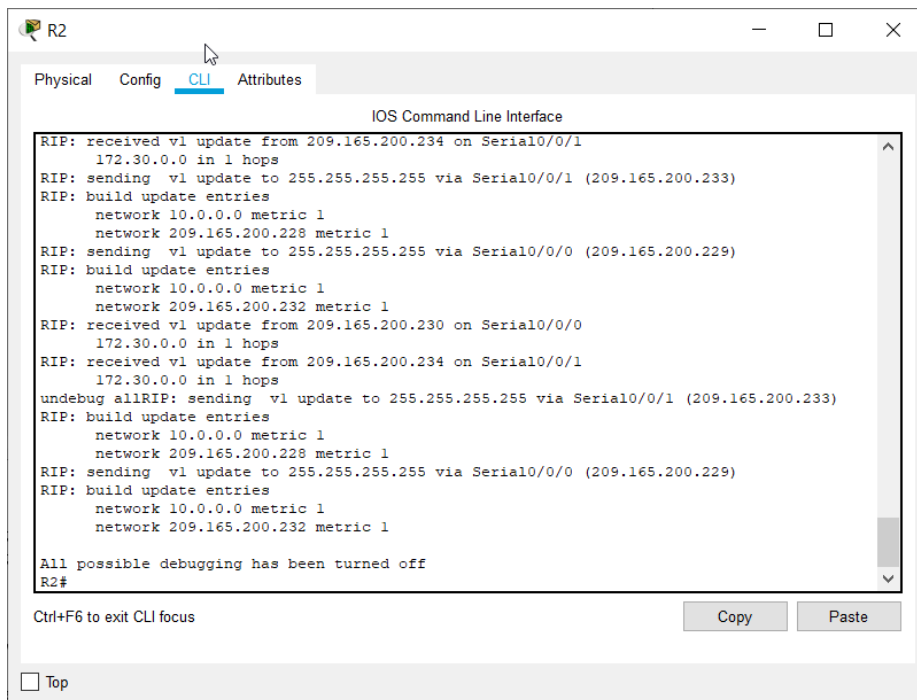

The screenshot shows the R2 CLI window with the 'CLI' tab selected. The output displays a continuous loop of RIP protocol messages. It shows R2 sending updates to 255.255.255.255 via Serial0/0/1 and Serial0/0/0. The updates include network 10.0.0.0/24 and 209.165.200.228/24. It also shows R2 receiving updates from 209.165.200.230 and 209.165.200.234, which include the 172.30.0.0/24 network. The messages are repeated, indicating a continuous debugging session.

```
R2#RIP: sending v1 update to 255.255.255.255 via Serial0/0/1 (209.165.200.233)
RIP: build update entries
    network 10.0.0.0 metric 1
    network 209.165.200.228 metric 1
RIP: sending v1 update to 255.255.255.255 via Serial0/0/0 (209.165.200.229)
RIP: build update entries
    network 10.0.0.0 metric 1
    network 209.165.200.232 metric 1
RIP: received v1 update from 209.165.200.230 on Serial0/0/0
    172.30.0.0 in 1 hops
RIP: received v1 update from 209.165.200.234 on Serial0/0/1
    172.30.0.0 in 1 hops
RIP: sending v1 update to 255.255.255.255 via Serial0/0/1 (209.165.200.233)
RIP: build update entries
    network 10.0.0.0 metric 1
    network 209.165.200.228 metric 1
RIP: sending v1 update to 255.255.255.255 via Serial0/0/0 (209.165.200.229)
RIP: build update entries
    network 10.0.0.0 metric 1
    network 209.165.200.232 metric 1
RIP: received v1 update from 209.165.200.230 on Serial0/0/0
    172.30.0.0 in 1 hops
RIP: received v1 update from 209.165.200.234 on Serial0/0/1
    172.30.0.0 in 1 hops
```

R2 is sending only the routes for the 10.0.0.0 LAN and the two serial connections to R1 and R3. R1 and R3 are not receiving any information about the 172.30.0.0 subnet routes.

When you are finished, turn off the debugging.

R2#**undeb**ug all

The screenshot shows the R2 CLI window after the 'undeb'ug all command has been executed. The output shows the final RIP messages, including the 'undeb'ug allRIP: sending v1 update to 255.255.255.255 via Serial0/0/1 (209.165.200.233)' message. Below this, a message states 'All possible debugging has been turned off'. The prompt returns to 'R2#'.

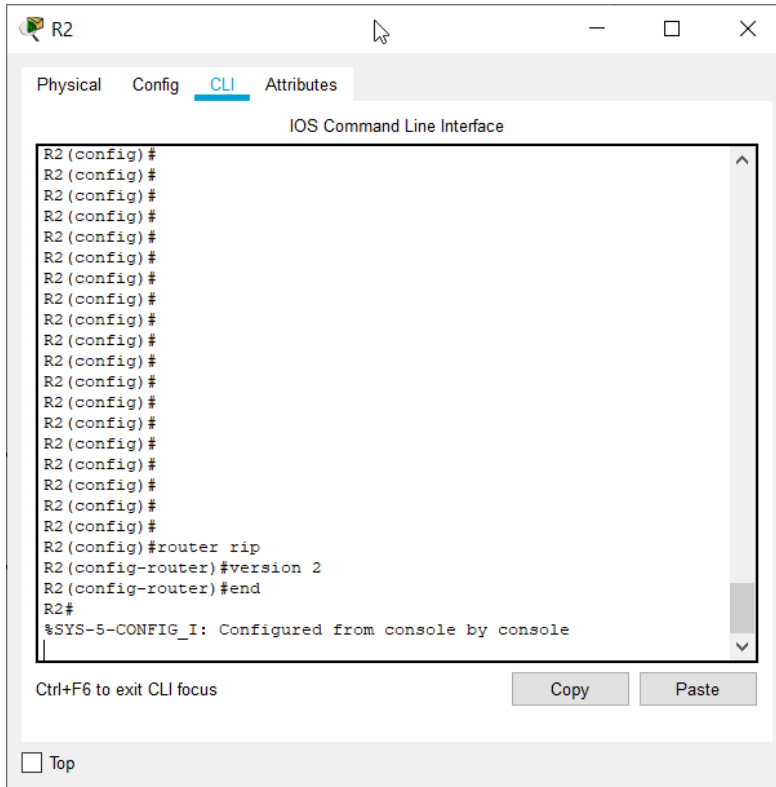

```
RIP: received v1 update from 209.165.200.234 on Serial0/0/1
    172.30.0.0 in 1 hops
RIP: sending v1 update to 255.255.255.255 via Serial0/0/1 (209.165.200.233)
RIP: build update entries
    network 10.0.0.0 metric 1
    network 209.165.200.228 metric 1
RIP: sending v1 update to 255.255.255.255 via Serial0/0/0 (209.165.200.229)
RIP: build update entries
    network 10.0.0.0 metric 1
    network 209.165.200.232 metric 1
RIP: received v1 update from 209.165.200.230 on Serial0/0/0
    172.30.0.0 in 1 hops
RIP: received v1 update from 209.165.200.234 on Serial0/0/1
    172.30.0.0 in 1 hops
undeb'ug allRIP: sending v1 update to 255.255.255.255 via Serial0/0/1 (209.165.200.233)
RIP: build update entries
    network 10.0.0.0 metric 1
    network 209.165.200.228 metric 1
RIP: sending v1 update to 255.255.255.255 via Serial0/0/0 (209.165.200.229)
RIP: build update entries
    network 10.0.0.0 metric 1
    network 209.165.200.232 metric 1
All possible debugging has been turned off
R2#
```

Task 4: Configure RIP Version 2.

Step 1: Use the `version 2` command to enable RIP version 2 on each of the routers.

```
R2 (config)#router rip
```

```
R2 (config-router) #version 2
```

```
R1 (config)#router rip
```

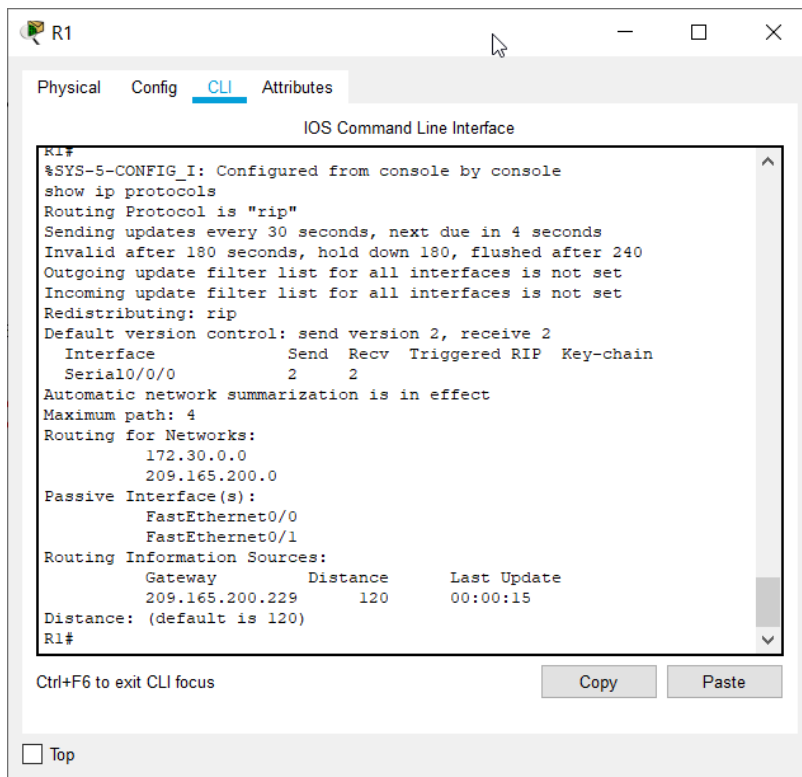

```
R1 (config-router) #version 2
```

RIPv2 messages include the subnet mask in a field in the routing updates. This allows subnets and their masks to be included in the routing updates. However, by default RIPv2 summarizes networks at major network boundaries, just like RIPv1, except that the subnet mask is included in the update.

Step 2: Verify that RIPv2 is running on the routers.

The `debug ip rip`, `show ip protocols`, and `show run` commands can all be used to confirm that RIPv2 is running. The output of the `show ip protocols` command for R1 is shown below.

```
R1# show ip protocols
```

The screenshot shows a window titled 'R1' with tabs for 'Physical', 'Config', 'CLI', and 'Attributes'. The 'CLI' tab is active, displaying the 'IOS Command Line Interface'. The output of the 'show ip protocols' command is shown in a text area. Below the text area are 'Copy' and 'Paste' buttons, and a 'Top' button at the bottom left.

```
R1#

Task 5: Examine the Automatic Summarization of Routes.

The LANs connected to R1 and R3 are still composed of discontinuous networks. R2 still shows two equal cost paths to the 172.30.0.0/16 network in the routing table. R2 still shows only the major classful network address of 172.30.0.0 and does not show any of the subnets for this network.

```
R2#show ip route
```

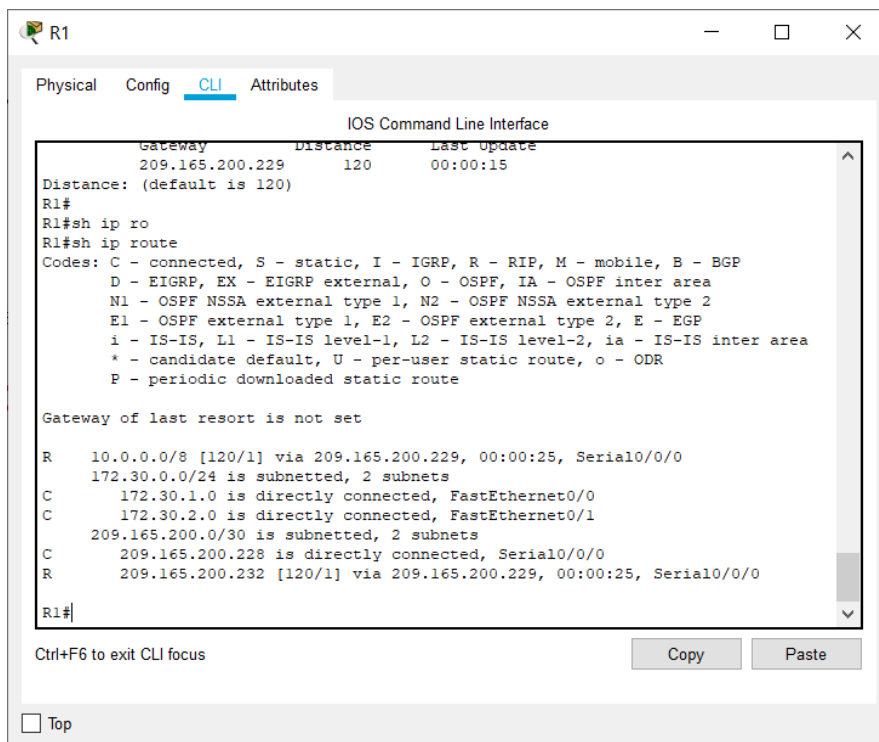

```
Distance: (default is 120)
R2#
R2#
R2#
R2#
R2#show ip route
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default, U - per-user static route, o - ODR
       P - periodic downloaded static route

Gateway of last resort is not set

  10.0.0.0/16 is subnetted, 1 subnets
C    10.1.0.0 is directly connected, FastEthernet0/0
R    172.30.0.0/16 [120/1] via 209.165.200.234, 00:00:01, Serial0/0/1
               [120/1] via 209.165.200.230, 00:00:05, Serial0/0/0
 209.165.200.0/30 is subnetted, 2 subnets
C    209.165.200.228 is directly connected, Serial0/0/0
C    209.165.200.232 is directly connected, Serial0/0/1
R2#
```

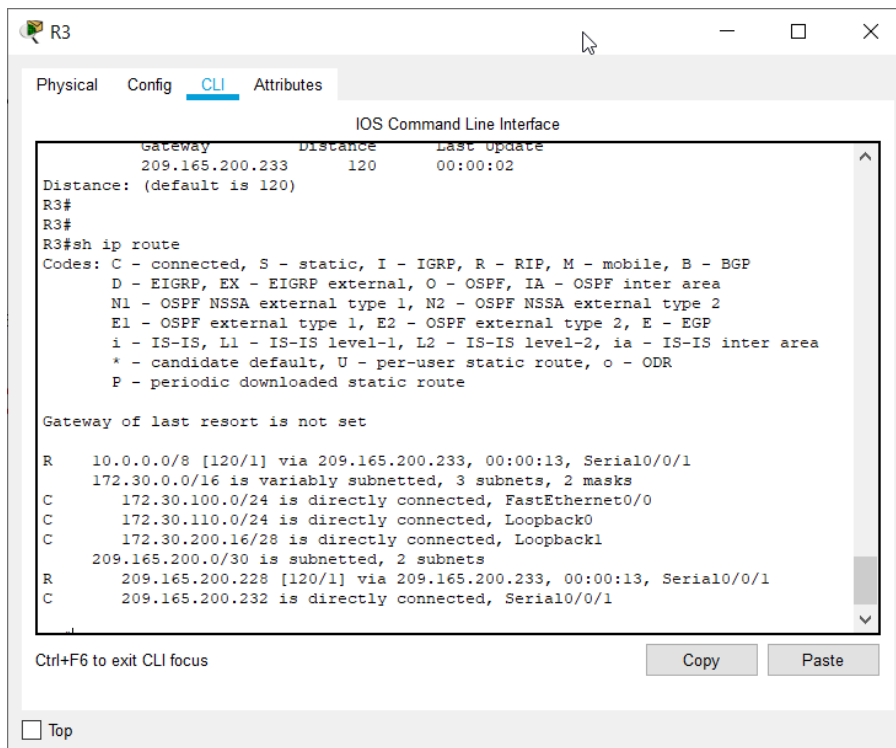

R1 still shows only its own subnets for the 172.30.0.0 network. R1 still does not have any routes for the 172.30.0.0 subnets on R3.

```
R1#show ip route
```

R3 still only shows its own subnets for the 172.30.0.0 network. R3 still does not have any routes for the 172.30.0.0 subnets on R1.

R3#**show ip route**

Use the output of the `debug ip rip` command to answer the following questions:

What entries are included in the RIP updates sent out from R3?

```
RIP protocol debugging is on
R3#RIP: received v2 update from 209.165.200.233 on Serial0/0/1
10.0.0.0/8 via 0.0.0.0 in 1 hops
209.165.200.228/30 via 0.0.0.0 in 1 hops

```

10.0.0.0/8

172.30.100.0/24

172.30.110.0/24

172.30.200.16/28

209.165.200.0/24

On R2, what routes are in the RIP updates that are received from R3?

```
RIP protocol debugging is on
R2#RIP: sending v2 update to 224.0.0.9 via Serial0/0/1 (209.165.200.233)
RIP: build update entries
10.0.0.0/8 via 0.0.0.0, metric 1, tag 0
209.165.200.228/30 via 0.0.0.0, metric 1, tag 0
RIP: sending v2 update to 224.0.0.9 via Serial0/0/0 (209.165.200.229)
RIP: build update entries
10.0.0.0/8 via 0.0.0.0, metric 1, tag 0
209.165.200.232/30 via 0.0.0.0, metric 1, tag 0
RIP: received v2 update from 209.165.200.230 on Serial0/0/0
172.30.0.0/16 via 0.0.0.0 in 1 hops
RIP: received v2 update from 209.165.200.234 on Serial0/0/1
172.30.0.0/16 via 0.0.0.0 in 1 hops
```

10.0.0.0/8

209.165.200.228/30

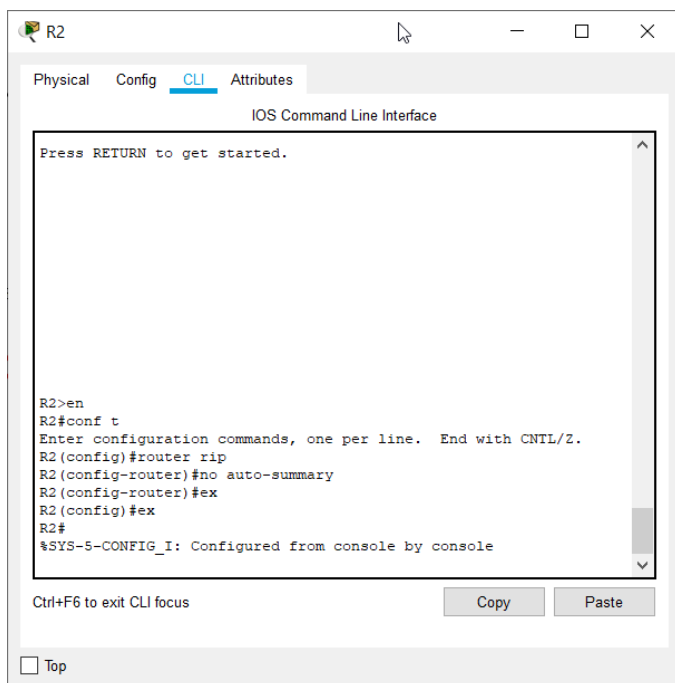

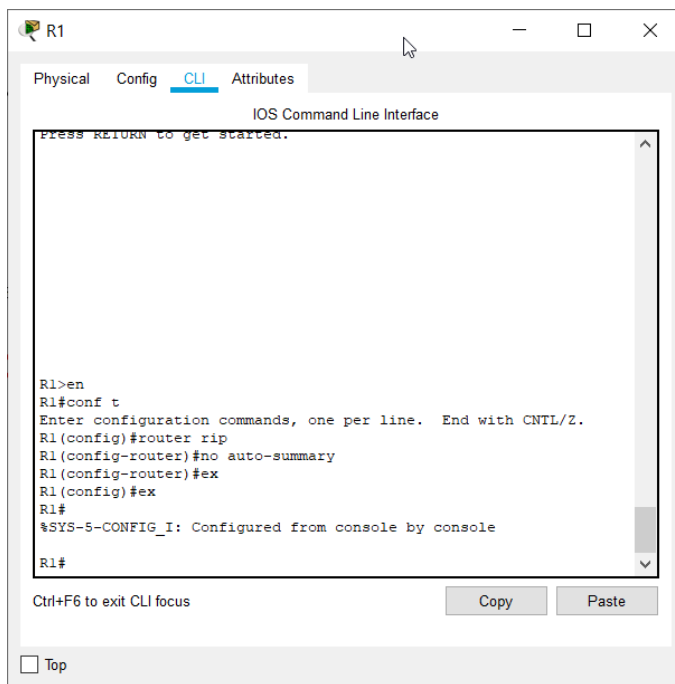

172.30.0.0/16

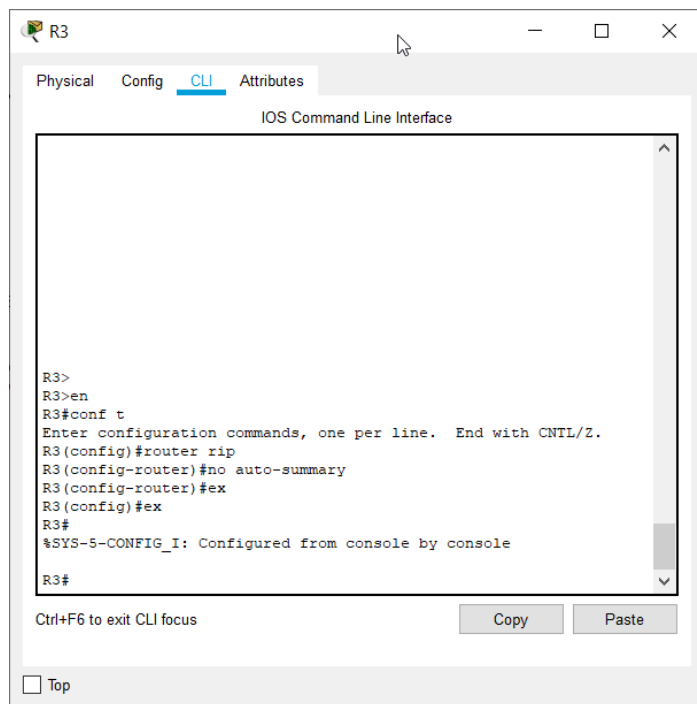

R3 is not sending any of the 172.30.0.0 subnets—only the summarized route of 172.30.0.0/16, including the subnet mask. This is why R2 and R1 are not seeing the 172.30.0.0 subnets on R3.

Task 6: Disable Automatic Summarization.

The **no auto-summary** command is used to turn off automatic summarization in RIPv2. Disable auto summarization on all routers. The routers will no longer summarize routes at major network boundaries.

```
R2 (config) #router rip  
R2 (config-router) #no auto-summary
```

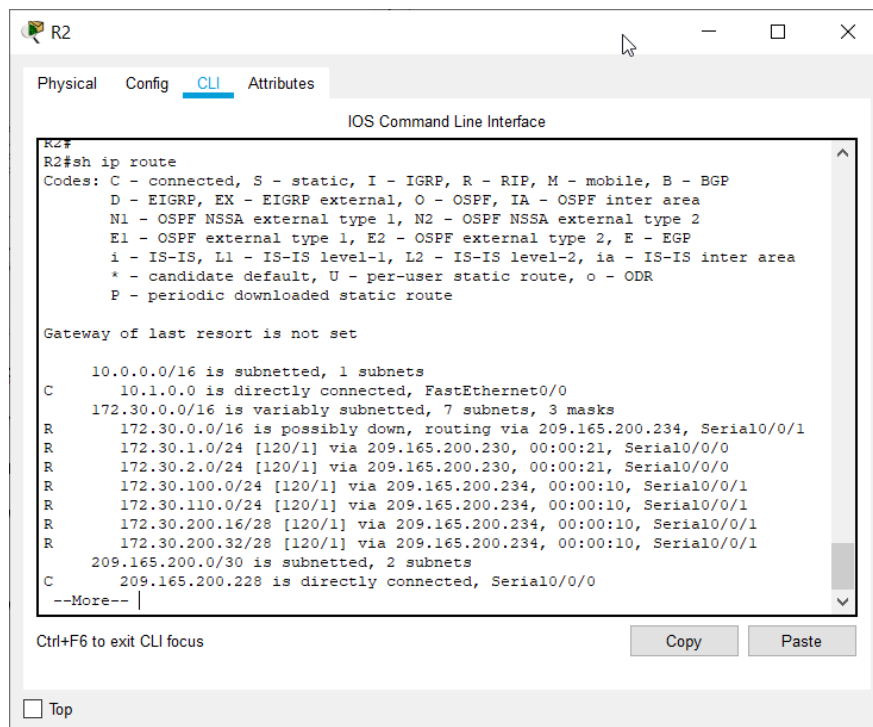

The **show ip route** and **ping** commands can be used to verify that automatic summarization is off.

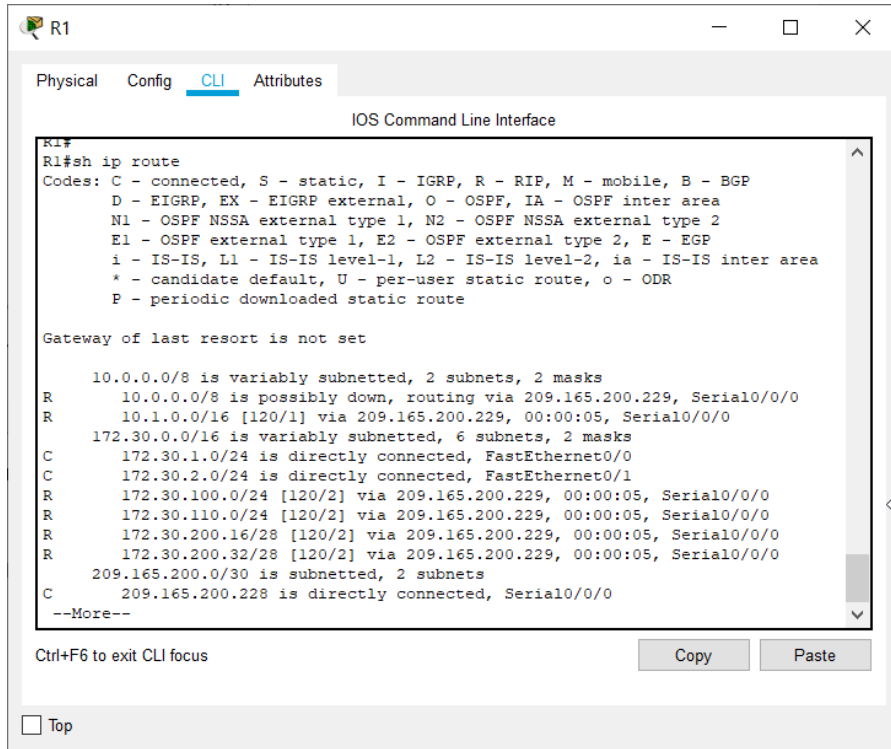

Task 7: Examine the Routing Tables.

The LANs connected to R1 and R3 should now be included in all three routing tables.

R2#**show ip route**

R1#show ip route

The screenshot shows a Cisco IOS CLI window for router R1. The 'CLI' tab is selected. The output of the 'show ip route' command is displayed, showing various routes including 10.0.0.0/8, 10.1.0.0/16, 172.30.0.0/16, 172.30.1.0/24, 172.30.2.0/24, 172.30.100.0/24, 172.30.110.0/24, 172.30.200.16/28, 172.30.200.32/28, 209.165.200.0/30, and 209.165.200.228. The output is truncated with '--More--' at the bottom. A 'Top' button is visible at the bottom left of the window.

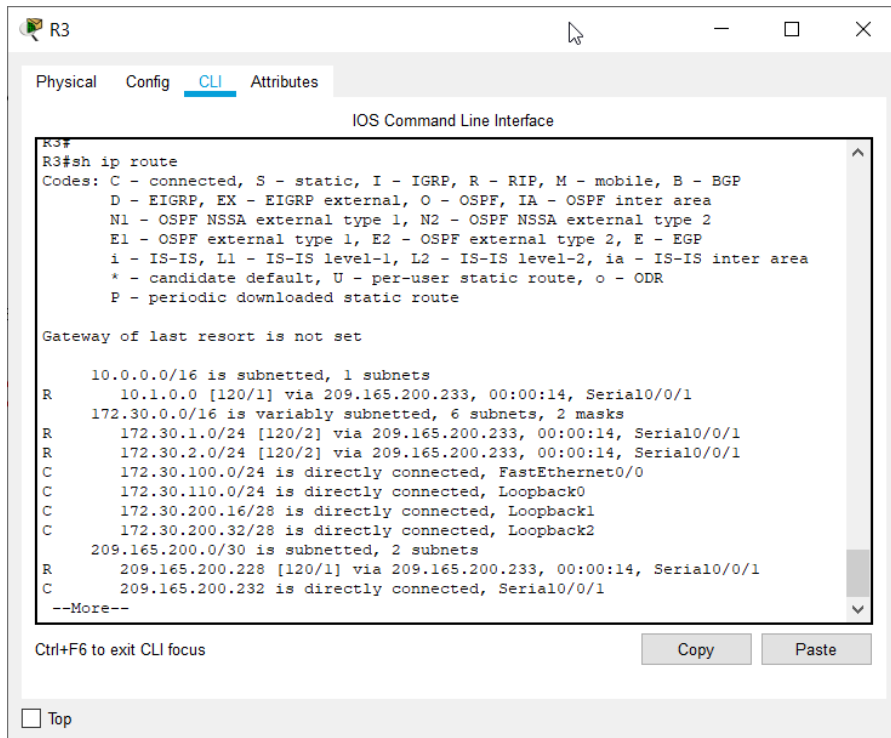

```

Ctrl+F6 to exit CLI focus
```

Use the output of the `debug ip rip` command to answer the following questions:

What entries are included in the RIP updates sent out from R1?

172.30.1.0/24

172.30.2.0/24

On R2, what routes are in the RIP updates that are received from R1?

A screenshot of the R2 router's CLI interface. The window title is 'R2'. The tabs are 'Physical', 'Config', 'CLI' (selected), and 'Attributes'. The main area is titled 'IOS Command Line Interface' and shows a series of RIP update messages. The messages include: '172.30.2.0/24 via 0.0.0.0, metric 2, tag 0', '209.165.200.228/30 via 0.0.0.0, metric 1, tag 0', 'RIP: sending v2 update to 224.0.0.9 via Serial0/0/0 (209.165.200.229)', 'RIP: build update entries', '10.1.0.0/16 via 0.0.0.0, metric 1, tag 0', '172.30.100.0/24 via 0.0.0.0, metric 2, tag 0', '172.30.110.0/24 via 0.0.0.0, metric 2, tag 0', '172.30.200.16/28 via 0.0.0.0, metric 2, tag 0', '172.30.200.32/28 via 0.0.0.0, metric 2, tag 0', '209.165.200.232/30 via 0.0.0.0, metric 1, tag 0', 'RIP: received v2 update from 209.165.200.230 on Serial0/0/0', '172.30.1.0/24 via 0.0.0.0 in 1 hops', '172.30.2.0/24 via 0.0.0.0 in 1 hops', 'RIP: received v2 update from 209.165.200.234 on Serial0/0/1', '172.30.100.0/24 via 0.0.0.0 in 1 hops', '172.30.110.0/24 via 0.0.0.0 in 1 hops', '172.30.200.16/28 via 0.0.0.0 in 1 hops', '172.30.200.32/28 via 0.0.0.0 in 1 hops', 'RIP: sending v2 update to 224.0.0.9 via Serial0/0/1 (209.165.200.233)', 'RIP: build update entries', '10.1.0.0/16 via 0.0.0.0, metric 1, tag 0', '172.30.1.0/24 via 0.0.0.0, metric 2, tag 0', '172.30.2.0/24 via 0.0.0.0, metric 2, tag 0', '209.165.200.228/30 via 0.0.0.0, metric 1, tag 0', and 'RIP: sending v2 update to 224.0.0.9 via Serial0/0/0 (209.165.200.229)'. The two lines '172.30.1.0/24 via 0.0.0.0 in 1 hops' and '172.30.2.0/24 via 0.0.0.0 in 1 hops' are highlighted in blue. At the bottom, there is a 'Ctrl+F6 to exit CLI focus' message and 'Copy' and 'Paste' buttons. A 'Top' button is also visible in the bottom left corner.

172.30.1.0/24

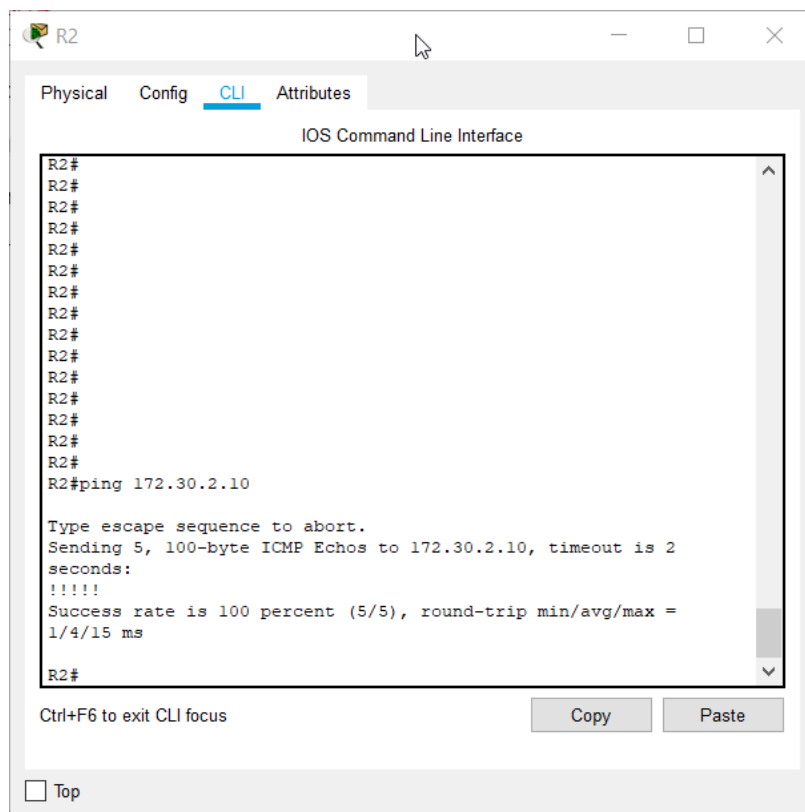

172.30.2.0/24

Are the subnet masks now included in the routing updates? **yes**

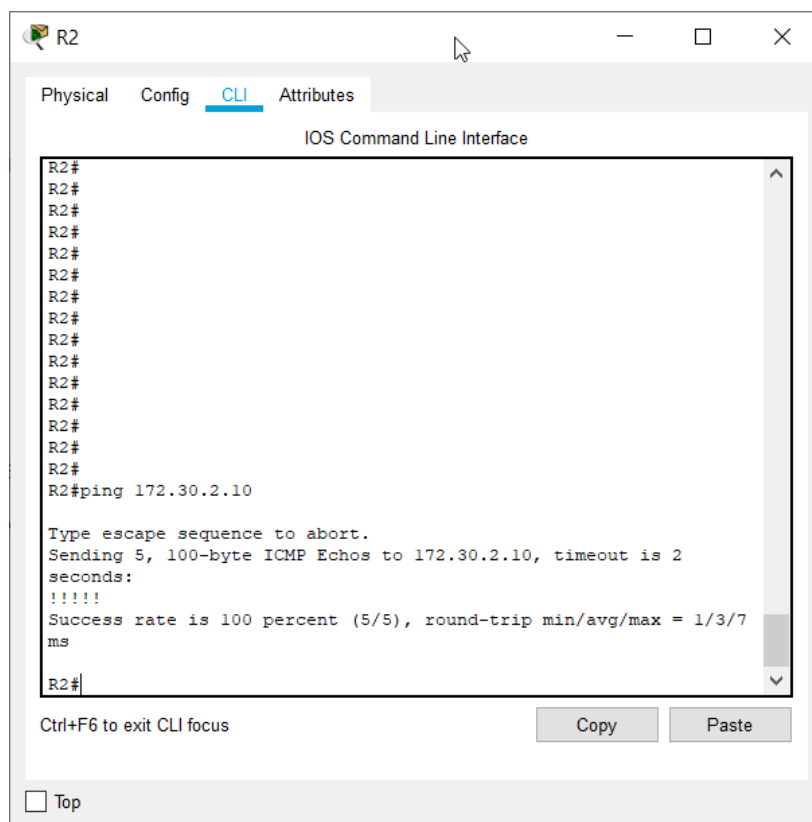

Task 8: Verify Network Connectivity.

Step 1: Check connectivity between R2 router and PCs.

From R2, how many ICMP messages are successful when pinging PC1? **5/5 messages**

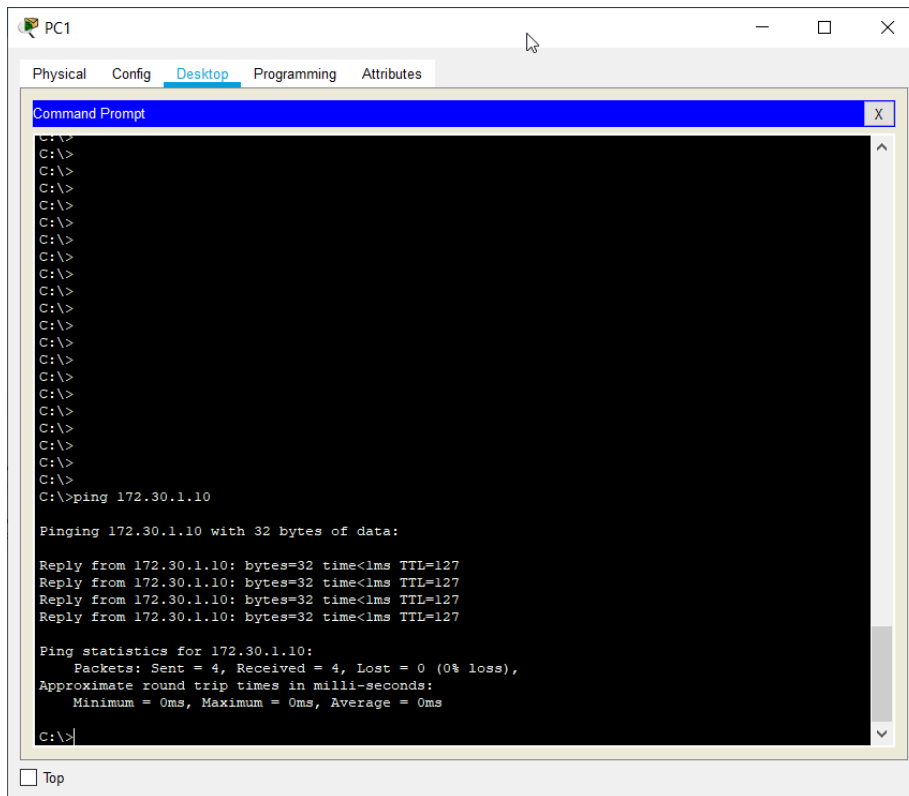

From R2, how many ICMP messages are successful when pingng PC4? **5/5 messages**

Step 2: Check the connectivity between the PCs.

From PC1, is it possible to ping PC2? **yes**

What is the success rate? 4/4

From PC1, is it possible to ping PC3? **yes**

What is the success rate? 4/4

The screenshot shows a Command Prompt window with the following text:

```
C:\>
C:\>
C:\>

C:\>
C:\>
C:\>
C:\>
C:\>ping 10.1.0.10

Pinging 10.1.0.10 with 32 bytes of data:

Reply from 10.1.0.10: bytes=32 time=1ms TTL=126
Reply from 10.1.0.10: bytes=32 time=1ms TTL=126
Reply from 10.1.0.10: bytes=32 time=1ms TTL=126
Reply from 10.1.0.10: bytes=32 time=1ms TTL=126

Ping statistics for 10.1.0.10:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 1ms, Maximum = 1ms, Average = 1ms

C:\>
```

Below the Command Prompt window, there is a checkbox labeled "Top" which is currently unchecked.

From PC1, is it possible to ping PC4? **yes**

What is the success rate? **4/4**

The screenshot shows a Command Prompt window on PC1 with the following text:

```
C:\>
C:\>
C:\>
C:\>
C:\>
C:\>
C:\>
C:\>
C:\>
C:\>
C:\>

C:\>ping 172.30.100.10

Pinging 172.30.100.10 with 32 bytes of data:

Reply from 172.30.100.10: bytes=32 time=2ms TTL=125
Reply from 172.30.100.10: bytes=32 time=2ms TTL=125
Reply from 172.30.100.10: bytes=32 time=2ms TTL=125
Reply from 172.30.100.10: bytes=32 time=3ms TTL=125

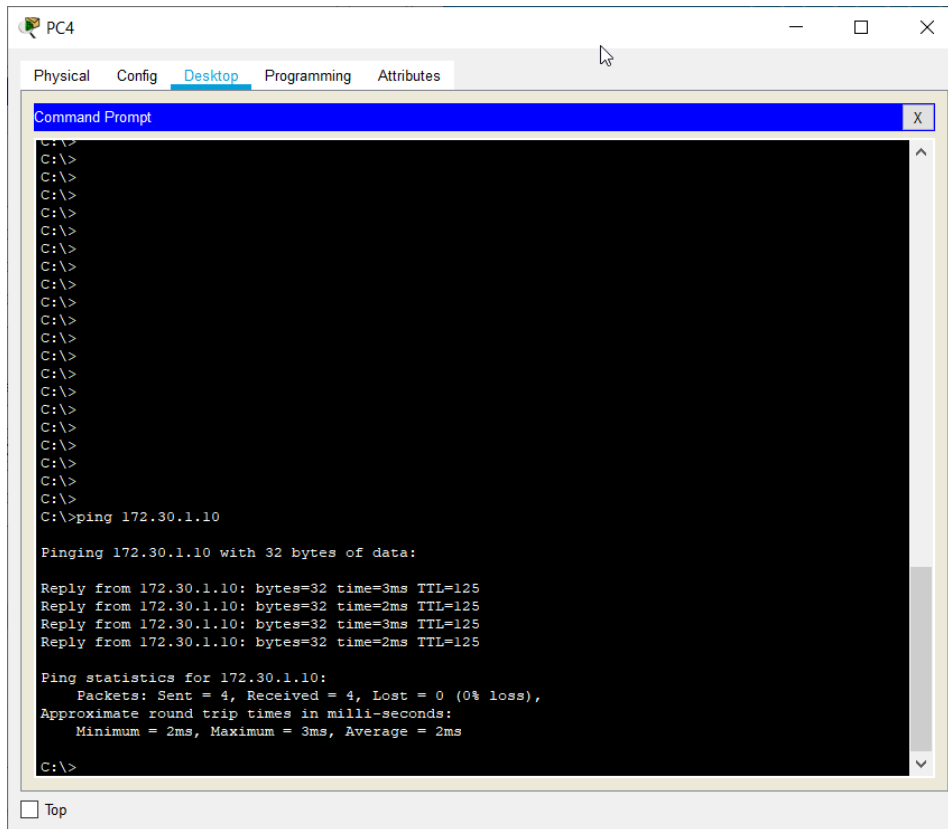

Ping statistics for 172.30.100.10:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 2ms, Maximum = 3ms, Average = 2ms

C:\>
```

Below the Command Prompt window, there is a checkbox labeled "Top" which is currently unchecked.

From PC4, is it possible to ping PC2? **yes**

What is the success rate? **4/4**

The screenshot shows a window titled "PC4" with tabs for "Physical", "Config", "Desktop", "Programming", and "Attributes". The "Desktop" tab is active, displaying a "Command Prompt" window. The Command Prompt shows a series of "C:\>" prompts, followed by the command "C:\>ping 172.30.1.10". The output of the ping command is as follows:

```
C:\>ping 172.30.1.10

Pinging 172.30.1.10 with 32 bytes of data:

Reply from 172.30.1.10: bytes=32 time=3ms TTL=125
Reply from 172.30.1.10: bytes=32 time=2ms TTL=125
Reply from 172.30.1.10: bytes=32 time=3ms TTL=125
Reply from 172.30.1.10: bytes=32 time=2ms TTL=125

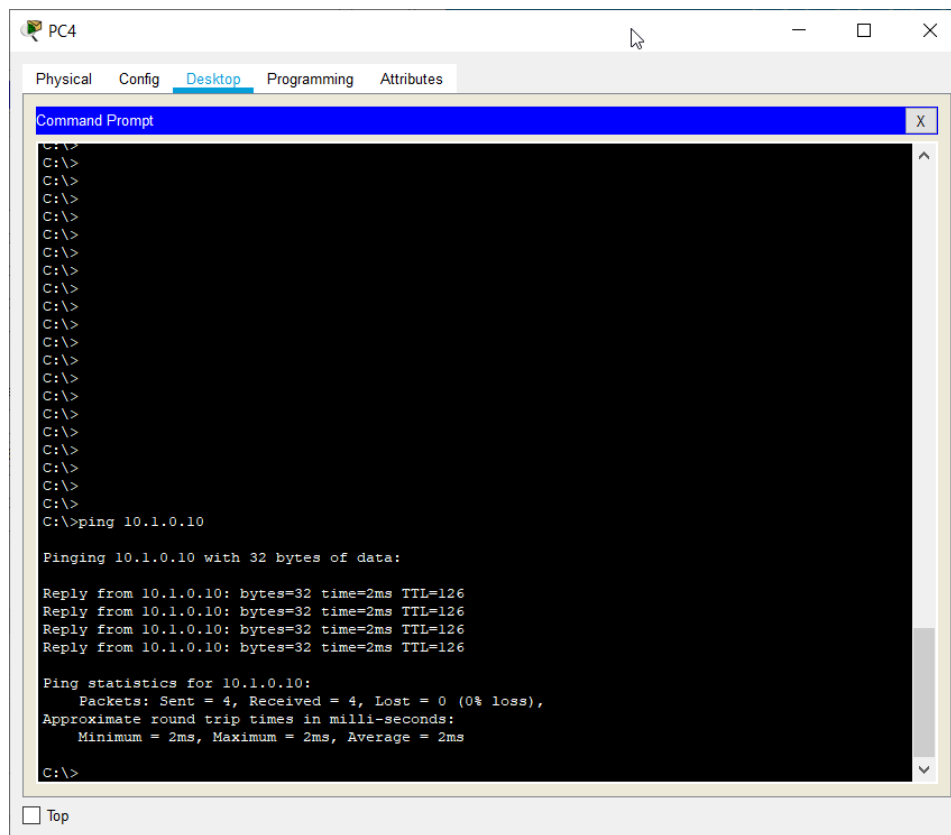

Ping statistics for 172.30.1.10:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 2ms, Maximum = 3ms, Average = 2ms

C:\>
```

At the bottom of the window, there is a checkbox labeled "Top" which is currently unchecked.

From PC4, is it possible to ping PC3? **yes**

What is the success rate? **4/4**

Task 9: Documentation

On each router, capture the following command output to a text (.txt) file and save for future reference.

Task 10: Clean Up

Erase the configurations and reload the routers. Disconnect and store the cabling. For PC hosts that are normally connected to other networks (such as the school LAN or to the Internet), reconnect the appropriate cabling and restore the TCP/IP settings.

Since there is no PC host which are connected to other networks, we disconnect cabling and reload the routers after erasing the configurations

Hence, we have Erased all configurations and disconnected and stored the cables.
